AAA Demonstrates the Iron Python Improved Rail Technology Helps Bring Safety and Efficiency to the Train Yard

(Minneapolis, MN) – AAA Sales & Engineering displayed the Iron Python Car/Train Holding Device at the 2011 RSSI Railway Interchange Trade show in Minneapolis, MN. The display of the unique device attracted a great deal of attention, drawing crowds and several inquiries as the AAA Sales Team fielded several questions about the innovative product.

The Iron Python was designed for both arrival and departure tracks, and is used during unloading operations to locate cars and absorb impact from cars that are not well spotted. In cases where a car approaches at high impact speeds, the Iron Python will safely derail the car. The Iron Python provides a safeguard in sensitive areas like the main line, car shop and dumper by restraining the movement of a single car or an entire train, making it one of the safest ways to protect both tracks and people.
