AAA Announces New Iron Python Improved Rail Technology Helps Bring Safety and Efficiency to the Train Yard

(Oak Creek, WI) – With the launch of the new Iron Python, AAA Sales & Engineering provides a multi-purpose product that serves as both a train-holding device and train chock. The Iron Python is designed to improve locomotive and railcar utilization, reduce fuel consumption and save railcar repair costs.

This new product was designed for both arrival and departure tracks, and is used during unloading operations to locate cars and absorb impact from cars that are not well spotted. In cases where a car approaches at high impact speeds, the Iron Python will safely derail the car. The Iron Python provides a safeguard in sensitive areas like the main line, car shop and dumper by restraining the movement of a single car or an entire train, making it one of the safest ways to protect both tracks and people.

AAA Sales & Engineering, Inc. is an ISO Certified, privately held, family-run manufacturing company that has been doing business since 1968. AAA Sales & Engineering has three separate and distinct operating divisions; the Railroad Division, the Production Machining Division and the Short Run/Prototype Division.
